

At the core is Business Continuity, which aims to minimize disruptions and maintain operations during critical events. Stakeholders, impacted by disruptions, have a vested interest in a robust plan.

Risk Management identifies potential threats, while BIA assesses their impact on business functions. Project Management then helps implement and test Business Continuity plans.

Supporting this core are practices like ITSM, which ensures critical IT services are available. DevOps fosters collaboration for faster IT recovery, while FinOps optimizes IT spending to free up resources for Business Continuity measures. Finally, XOps encompasses broader cross-functional operations, including DevOps and FinOps, contributing to smooth IT operations essential for Business Continuity.
