

[401] Enterprise Architecture is a concept similar to a management system and consists of a framework to align assets and operations with business goals. Effectively managing enterprise architecture is essential to administrate [498] technology research, facilitate [410] digital transformation, and handle the company's [460] technical debt, all while maintaining the business's goals and [491] value proposition.

An example of a technique to address technical debt is the model of [384] FinOps, used for financial management of [450] cloud services. And, a particularly important driver in the research area has been the concept of digital [441] identity and [443] digital wallets. Remembering, all must be done in legal compliance according to [449] eIDAS regulations.
